Photoshop is a fee-based program, but you can download it for free on the Adobe website. Photoshop's layers Photoshop uses layers to enable the creation of digital art. When you create a new document, a new layer is always created underneath the layer that's active. Each layer that you use for art has an associated box of numbers. The order of the box for each layer, from lowest number to highest, represents that layer's order in the stack. You use this number to work with the layers. Working in Photoshop The overall organization of a Photoshop project follows the typical flow of any type of digital project: Research and planning, concept and design, creation, editing, evaluation, and publishing. The box on Photoshop applications in Chapter 2 can help you better understand your exposure to Photoshop. Looking at a sample project In this chapter, you look at a sample of one image you can use as a study guide for the rest of the chapters in this book. The art you see here is the starting point for all the projects in the book. You can open the example files in this chapter by choosing File⇒Open, and then browsing to the sample files. Using the Reference Photo Because the image we use in this book is already edited, follow these steps to open the image for processing: 1. Choose File⇒Open, and navigate to and select the file you want to work with. 2. Click Open. Photoshop opens and displays the reference photo. Creating a new Photoshop file The steps in this section are similar to those for opening a file. To create a new document from scratch, choose File⇒New. Photoshop creates a new, empty document and adds the tool palette, layers, and everything you need to create a new project. However, before you can begin, you need to provide the following information to Photoshop: 1. Choose File⇒Options to open the Options dialog box. 2. Click the Preset tab to open the Preset Manager. 3. Choose Photo from the Preset drop-down list and click OK. Presets are saved by using the Photo option. These preset options can be imported into an existing image to use the same settings that you use in the projects in this book. You can get started with any of the following presets: • Organized: This preset

Q: How to Add a VBA auto indent to webpart I have a VBA Add-In, When adding the add-in to a page, I get the following error: The macro might not be declared. It may be inaccessible due to its protection level. How do I get a VBA add-in to auto indent like in other programming languages? Any help is appreciated. A: MS have specific documentations on the topic - here is part of it: When developing Visual Basic code, you can use any standard Visual Basic programming environment. You can use the Visual Basic editor without Visual Studio, the Visual Basic 6.0 IDE, or Visual Basic 2008 Express Edition. Although you can use all the features of Visual Basic, you need to pay particular attention to the security restrictions on Visual Basic for Applications (VBA). When developing VBA code, you must protect the macro that you create by using the default VBA protection settings, which you can modify through the Project Properties dialog box. And here is short test demonstrating how to use regexps to clean up trailing spaces (mine was perfectly legal ones): Sub AddIndent(MyControl As MSForms.WebPartContents) Dim s As String MyControl.ControlStyle.Indent = Not RegExCheck("(?
