

# Panosfx Complete Bundle Pack 21

The 21 layouts are inside the folder and need to be put into the GIMP actions folder. a larger one that is considered a good color wheel. But, this is a bit slow to work with. Shutterstock: color mix fonts for Adobe Photoshop template files are created using a professional grade color. All trademark and copyright held by Shutterstock.

PCR-based identification of the Papilionidae genera *Papilio* and *Carcharodus*. In the field of forensic identification, the Papilionidae (butterflies) family is an important tool because of its large and clear wings. DNA-based methods have been developed to minimize the error rate of identification of this family. We report the results of a study comparing 2 PCR-based methods for identification of *Papilio* (cabbage white) and *Carcharodus* (small carmine) butterflies. These 2 methods, PCR amplifying a mitochondrial (cytochrome oxidase II) marker or a 10-bp insertion within the barcoding region of the cytochrome b gene, were tested on a series of specimens. A 100% success rate of identification of *Papilio* was obtained from 40 adults (40 pairs of PCR products) and 38 larvae (38 pairs of PCR products) with both methods. The identification of *Carcharodus* was easier with the barcoding-PCR method because only 22 adults (22 pairs of PCR products) were needed to obtain 100% success rate. These results suggest that the barcoding-PCR method has some advantages over the standard mtDNA-based PCR method for *Papilio* and *Carcharodus* identification.

Vibration reduction using anisotropic viscoelastic properties and a three-mass lumped-element mechanical model of the knee joint. A model of the knee joint with two pairs of anisotropic viscoelastic materials is proposed to reduce vibration of the knee joint. The viscoelastic models are assumed to be loaded by combined inputs of vertical and torsional vibrations, which are present in many flexed postures of the knee joint. Each pair of viscoelastic materials is associated with a single spring and a single damper. The two pairs of springs and dampers are connected by the knee joint and their connection points form a three-mass lumped-element mechanical model. The proposed model can predict frequencies of vibration of the knee joint at flexed and extended postures of the knee joint. Furthermore, numerical results indicate that the proposed model can reduce
